

ABSTRACT

The Multi-Restaurant Online Food Ordering System project, using Python and Django, aims to provide a seamless experience for all involved. It allows administrators to easily add food categories, register restaurants, and add multiple delivery persons. Customers can add food to their cart, order, and assign delivery persons for deliveries. The project consists of four modules: Administrator, Restaurant, Customer, and Delivery. The first module, User Authentication and Registration, user can perform their functionalities. The second module, Restaurant Management, allows restaurants to register and manage their food, add food, and update orders. The third module, Customer Management, allows customers to register and manage their orders. Evaluation criteria include completing user authentication and registration, successful implementation of restaurant management functionalities, customer management interface, and delivery person management.
